MATH 213 ASSIGNMENT 2

DUE: FRIDAY 23/10/2015

(1) For $1 \le i, j \le 2$, let $\mathbf{e}^{ij} = (e^{ij}_{k\ell})$ be the 2×2 matrix such that

$$e_{k\ell}^{ij} = \begin{cases} 1 & \text{if } i = k \text{ and } j = \ell, \\ 0 & \text{otherwise.} \end{cases}$$

- (a) Write down the matrices e^{ij} for all i, j. (That is, parse and understand the definition of e^{ij} .)
- (b) Compute $(\mathbf{e}^{ij})^2$ for all i, j.
- (c) A object x is called *idempotent* if $x^2 = x$ and *nilpotent* if $x^n = 0$ for some n. What are the nonidentity $(\neq 1)$ idempotent elements of **R**? What are the nonzero nilpotents elements of **R**?
- (d) Observe that the set of 2×2 matrices contains both nonidentity idempotents and nonzero nilpotents.
- (e) Find a 3×3 matrix such that $A^3 = 0$ but $A^2 \neq 0$?

(2) Let

$$A = \begin{pmatrix} 20 & -9 & 0 \\ 81 & -36 & -1 \\ -70 & 31 & 1 \end{pmatrix}, \qquad B = \begin{pmatrix} -7 & -6 & -4 & 11 \\ -3 & -5 & -5 & -1 \\ 3 & 2 & 1 & -6 \end{pmatrix}.$$

- (a) Find A^{-1} .
- (b) Write A as a product of elementary matrices.
- (c) Find an invertible matrix U such that UB is in reduced row echelon form.
- (3) (Lab 5, 13/10/2015) Let A be an $m \times n$ matrix and let B be an $n \times p$ matrix. Prove that $(AB)^T = B^T A^T.$
- (4) (Lab 6, 20/10/2015) Let $M_n(\mathbf{R})$ be the vector space of $n \times n$ matrices with real entries and let $W = \{A \in M_n(\mathbf{R}) : A^T = A\}.$

Prove that W is a subspace of $M_n(\mathbf{R})$. (W is called the space of symmetric matrices.)

1. Solutions

(1) (a)
$$e_{11} = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}$$
, $e_{12} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$, $e_{21} = \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix}$, $e_{22} = \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}$

(b)
$$e_{11}^2 = e_{11}, e_{12}^2 = \mathbf{0}, e_{21}^2 = \mathbf{0}, e_{22}^2 = e_{22}$$

- (c) The only idempotents in \mathbf{R} are 0 and 1. The only nipontent in \mathbf{R} is 0.
- (d) The matrices e_{11} and e_{22} are nonidentity, nonzero idempotents in $M_2(\mathbf{R})$; e_{12} and e_{21} are nonzero idempotents in $M_2(\mathbf{R})$.
- (e) If x and z are nonzero, then

$$A = \begin{pmatrix} 0 & x & y \\ 0 & 0 & z \\ 0 & 0 & 0 \end{pmatrix}$$

satisfies $A^3 = \mathbf{0}$ and $A^2 \neq \mathbf{0}$.

(2) (a)
$$A^{-1} = \begin{pmatrix} 5 & -9 & -9 \\ 11 & -20 & -20 \\ 9 & -10 & -9 \end{pmatrix}$$

- (b) We record the elementary row operations we used to bring A to reduced row echelon form:
 - (i) Multiply row 1 by $-\frac{1}{20}$.
 - (ii) Add -81 times row 1 to row 2.
 - (iii) Add 70 times row 1 to row 3.
 - (iv) Multiply row 2 by $\frac{20}{9}$.
 - (v) Add $\frac{9}{20}$ times row 2 to row 1.
 - (vi) Add $\frac{1}{2}$ times row 2 to row 3.
 - (vii) Multiply row 3 by -9.
 - (viii) Add row 3 to row 1.
 - (ix) Add $\frac{20}{9}$ times row 3 to row 2.

Therefore,

$$A^{-1} = E_{iy} E_{viii} E_{vii} E_{vi} E_{v} E_{iy} E_{iy} E_{ii} E_{ii}$$

where $E_?$ is the elementary matrix associated to the elementary row operation performed in step (?). Inverting both sides and applying the 9-term generalization of the rule $(AB)^{-1} = B^{-1}A^{-1}$, we get

$$A^{-1} = E_{\rm i}^{-1} E_{\rm ii}^{-1} E_{\rm iii}^{-1} E_{\rm iv}^{-1} E_{\rm v}^{-1} E_{\rm vi}^{-1} E_{\rm vii}^{-1} E_{\rm viii}^{-1} E_{\rm ix}^{-1}.$$

Noting that $E_?^{-1}$ is elementary matrix associated to the inverse of the elementary row operation performed in step (?), we get

$$E_{\rm i}^{-1} = \begin{pmatrix} -20 & & \\ & 1 & \\ & & 1 \end{pmatrix}, \quad E_{\rm ii}^{-1} = \begin{pmatrix} 1 & & \\ 81 & 1 & \\ & & 1 \end{pmatrix}, \quad E_{\rm iii}^{-1} = \begin{pmatrix} 1 & & \\ & 1 & \\ -70 & & 1 \end{pmatrix}, \quad \dots$$

(c) Augment B by the 3×3 identity matrix and bring to reduced row echelon form:

$$(B \quad I) \longrightarrow \begin{pmatrix} 1 & 0 & 0 & -3 & 5 & -2 & 10 \\ 0 & 1 & 0 & 1 & -12 & 5 & -23 \\ 0 & 0 & 1 & 1 & 9 & -4 & 17 \end{pmatrix}$$

We take
$$U = \begin{pmatrix} 5 & -2 & 10 \\ -12 & 5 & -23 \\ 9 & -4 & 17 \end{pmatrix}$$
.

(3) Let a_{ij} be the (i,j)-entry of A and let b_{ij} be the (i,j) entry of B. Note that both $(AB)^T$ and B^TA^T are $p \times m$ matrices. So let i and j integers with $1 \le i \le p$ and $1 \le j \le m$. We need to show that the (i,j)-entry $(AB)^T$ equals the (i,j)-entry of B^TA^T .

By definition of transpose, the (i, j)-entry of $(AB)^T$ is the (j, i)-entry of AB. By definition of matrix multiplication, the (j, i) entry of AB is

$$(*) \sum_{k=1}^{n} a_{jk} b_{ki}.$$

By definition of matrix multiplication, the (i, j)-entry of $B^T A^T$ is

$$\sum_{k=1}^{n} \left((i, k) \text{-entry of } B^{T} \right) \left((k, j) \text{-entry of } A^{T} \right)$$

By definition of transpose, the (i, k)-entry of B^T is the (k, i)-entry of B, namely, b_{ki} . Similarly, the (k, j)-entry of A^T is a_{jk} . Therefore,

(**)
$$\sum_{k=1}^{n} ((i,k)\text{-entry of } B^{T}) ((k,j)\text{-entry of } A^{T}) = \sum_{k=1}^{n} b_{ki} a_{jk}.$$

Since the expression on the right hand side of (**) is the same as the expressin in (*), we are done.

(4) (I think I did this in class. Sorry if I spoiled your fun.) Let A and B be elements of W, i.e., A and B are matrices satisfying $A^T = A$. Then

$$(A+B)^T = A^T + B^T$$
 (You proved this in one of the labs.)
= $A+B$ (Since $A=A^T$ and $B=B^T$.)

Therefore, $A + B \in W$ and W is closed under addition. Similarly, if x is a scalar then

$$(xA)^T = xA^T$$
 (You proved this in one of the labs.)
= xA (Since $A = A^T$.)

Thus, W is closed under scalar multiplication. Being closed under addition and scalar multiplication, we conclude that W is a subspace of $M_n(\mathbf{R})$.
